

# 3 STEPS TO FLIP YOUR CLASSROOM USING SIMULATION

"Flipping" the classroom alleviates students' disconnect between theory and practice. Use this outline to guide you in understanding the benefits of combining sim with the flipped-classroom experience.

1

## USE A LEARNING MANAGEMENT SYSTEM.

An LMS allows students to access content at home via lectures, readings, or other self-paced activities. It allows you to track their use of these resources.

2

## ASSIGN LEARNING OUTSIDE THE CLASSROOM.

Instruct students to arrive in class ready to actively apply concepts and engage creatively in a dynamic, interactive learning environment. Check to make sure they actually used the resources before allowing them in to class.

3

## GUIDE THE CLASSROOM EXPERIENCE WITH A LESSON PLAN.

Your lesson plan should include:

A

A simulation tool that creates an environment where students will use what they learned before class in a real patient situation.

B

The opportunity for students to discuss problems they faced in the simulation.

C

Interactions allowing students to see the gaps in their thought processes compared to their peers.
